### Part 1

#### Visualizing and Understanding Convolutional Networks

Matthew D. Zeiler Dept. of Computer Science, Courant Institute, New York University

Rob Fergus Dept. of Computer Science, Courant Institute, New York University ZEILER@CS.NYU.EDU

FERGUS@CS.NYU.EDU

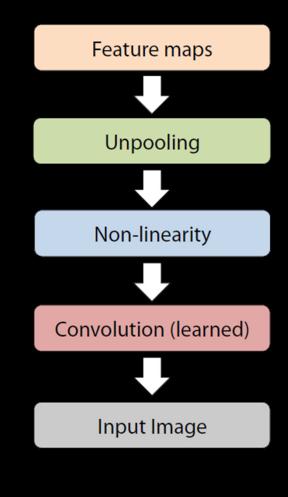

# Topics

- Visualization of conv net
  - What are they learning over layers
  - How learning changes with epochs
  - Feature invariance
  - Occlusion experiment
  - Part based model
- New architecture and Imagenet competition

   Change in model size, layers
- Model generalization

#### **Deconvolutional Networks**

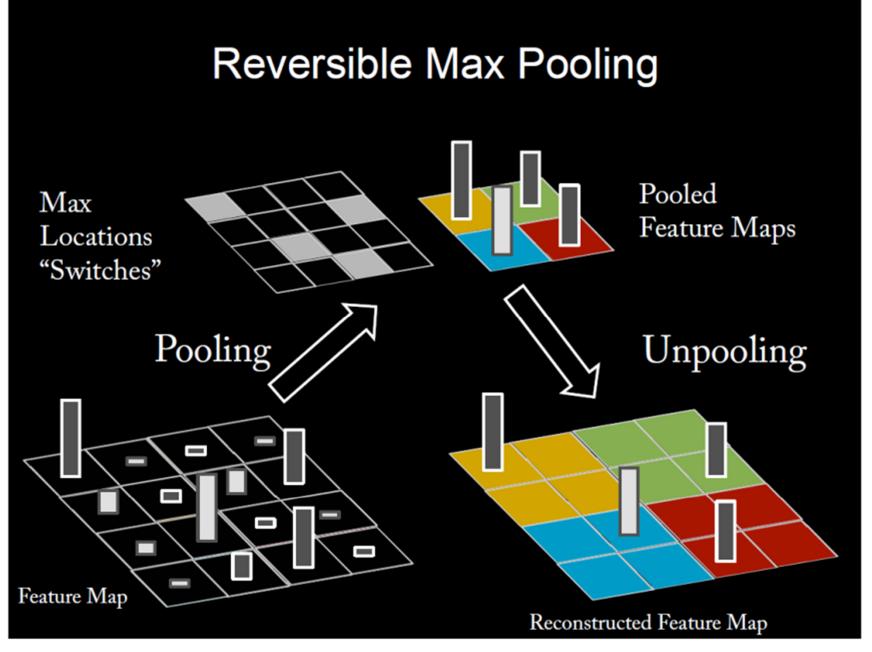

- Provides way to map activations at high layers back to the input
- Same operations as Convnet, but in reverse:
  - Unpool feature maps
  - Convolve unpooled maps
    - Filters copied from Convnet
- Used here purely as a probe
  - Originally proposed as unsupervised learning method
  - No inference, no learning

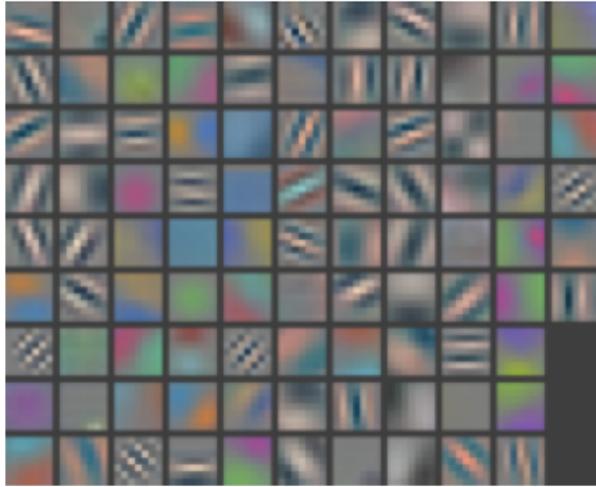

[Zeiler et al. CVPR'10, ICCV'11]

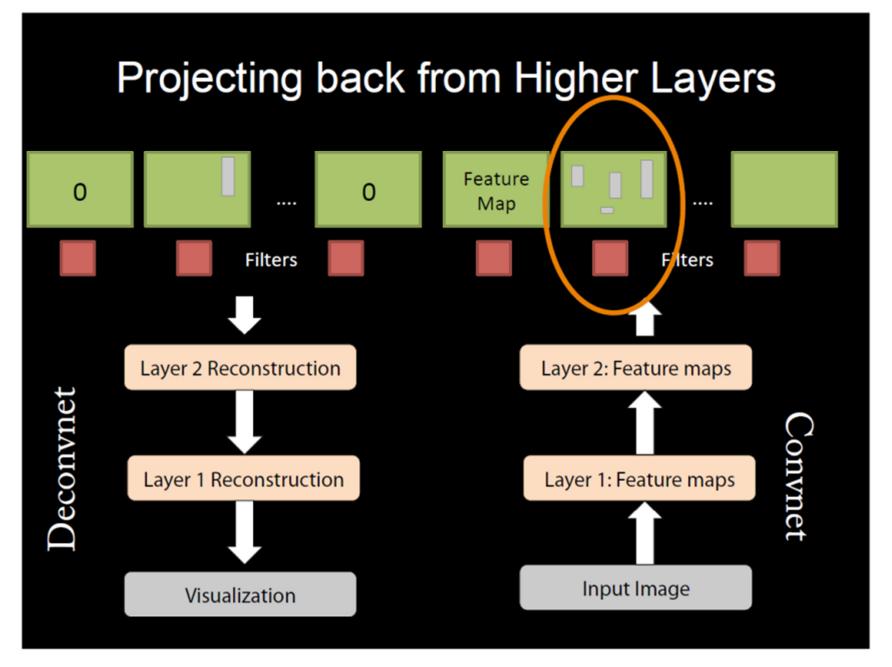

$$C = \frac{\lambda}{2} \|\sum_{k=1}^{K} z_k \oplus f_k - y\|_2^2 + \sum_{k=1}^{K} |z_k|_1$$
  
y = Input, z = Feature maps, f = Filters

Г

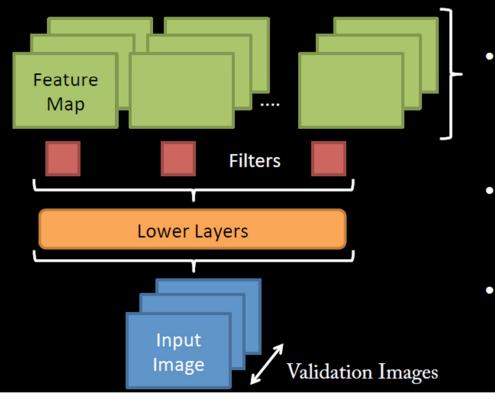

### Layer 1 Filters

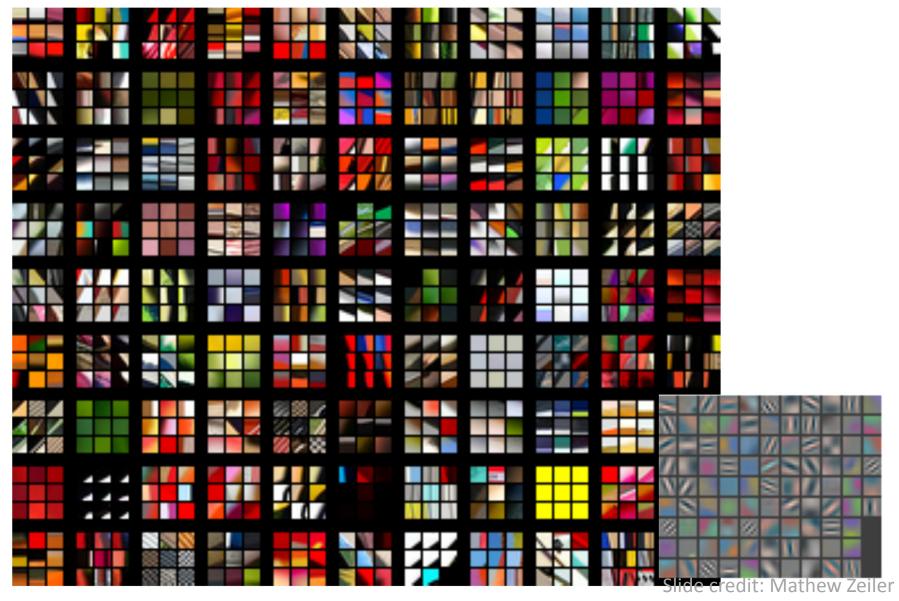

#### Visualizations of Higher Layers

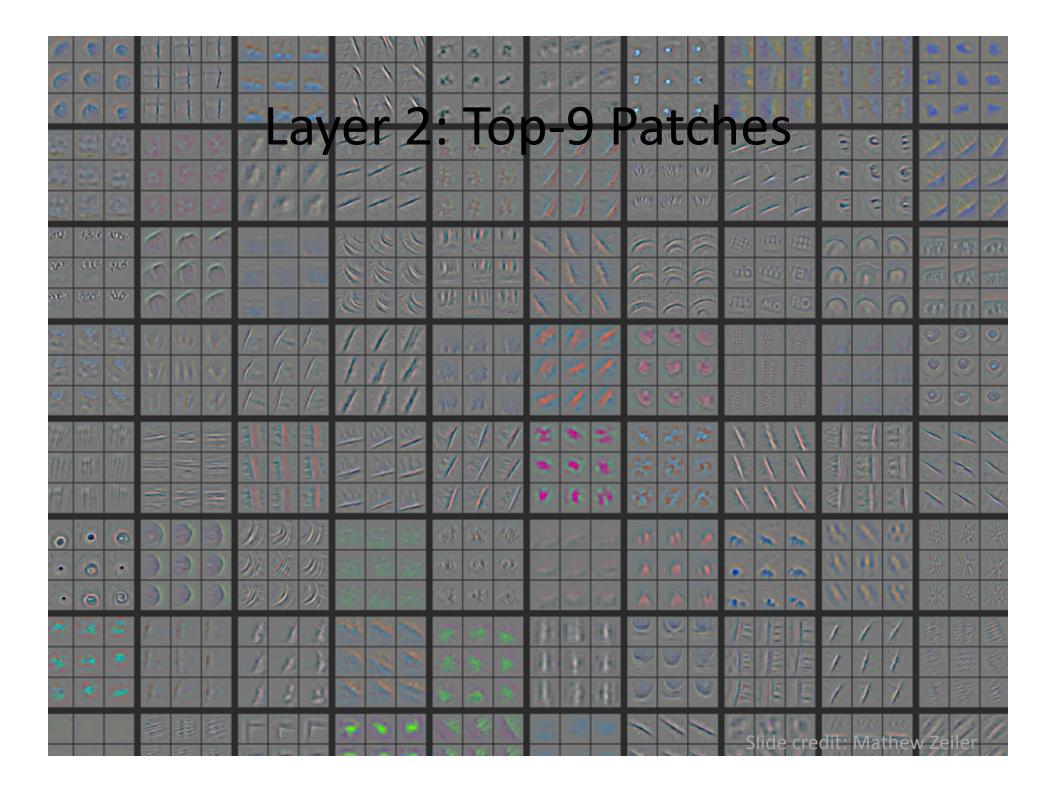

- Use ImageNet 2012 validation set
- Push each image through network

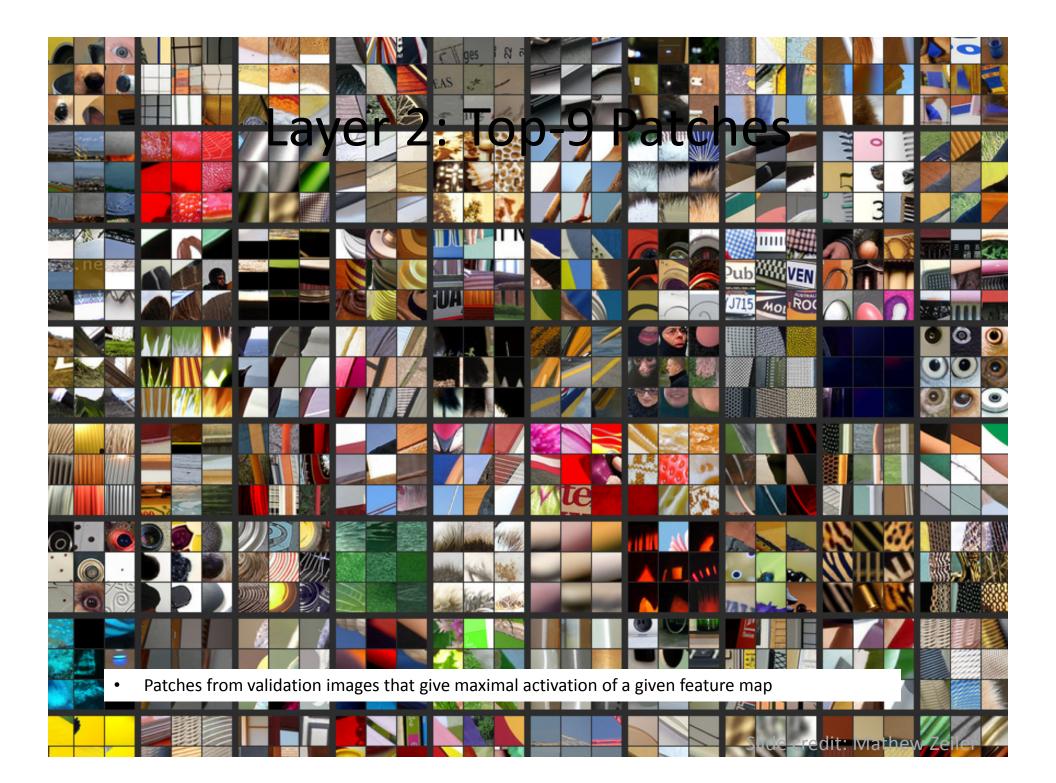

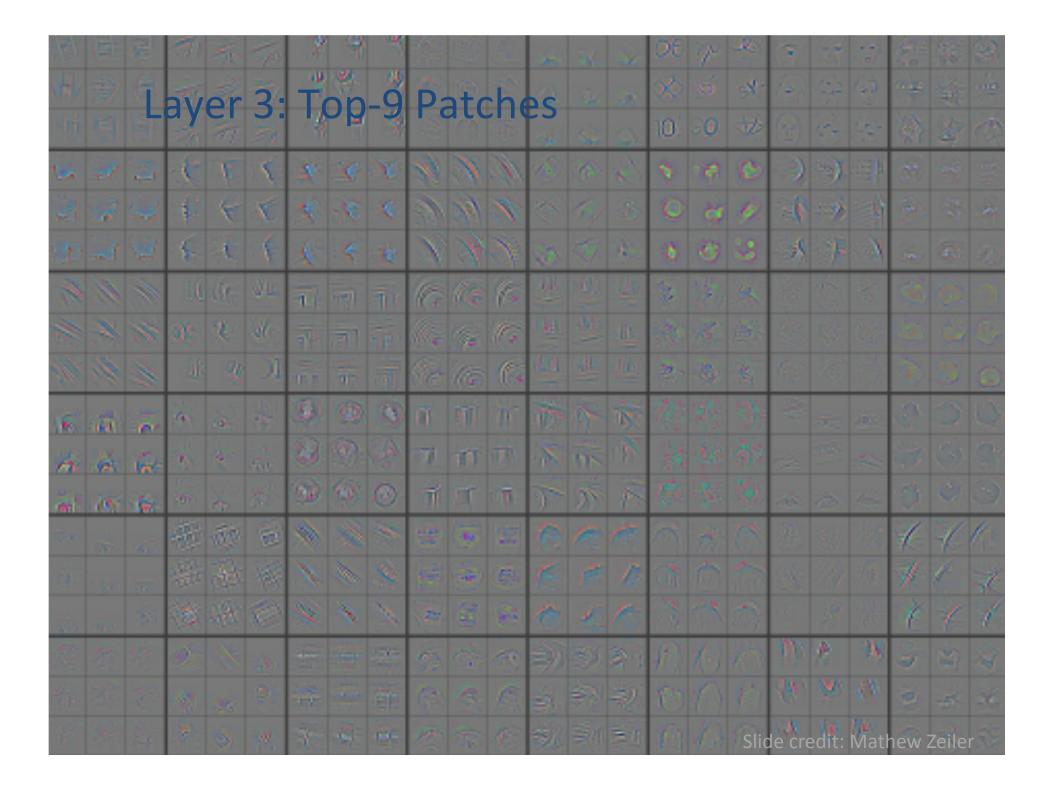

- Take max activation from feature map associated with each filter
- Use Deconvnet to project back to pixel space
- Use pooling "switches" peculiar to that activation

# Architecture selection

- Smaller stride (2 vs. 4) and smaller filters (7x7 vs. 11x11)
- Layer 1: more coverage of mid-frequencies
- Layer 2: no aliasing, no "dead" feature

### **Visualizing Convnets**

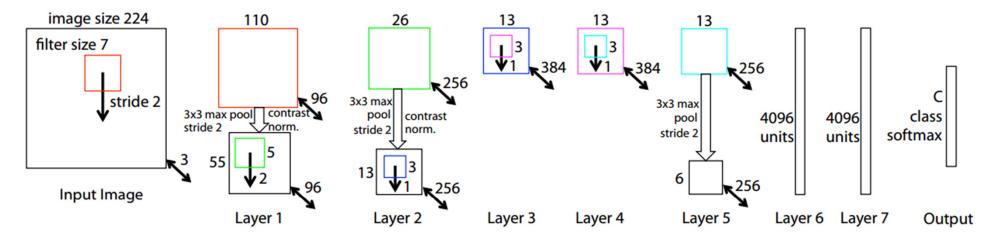

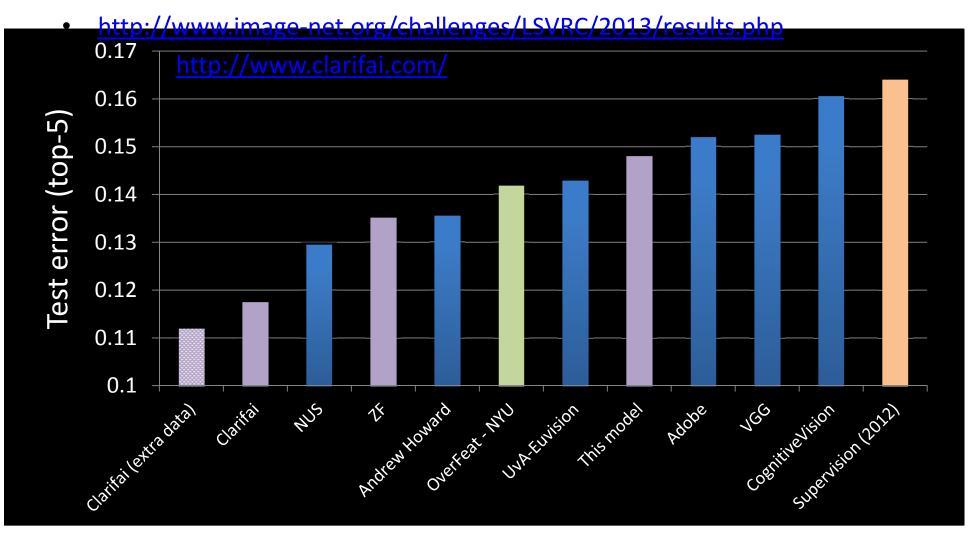

Figure 3. Architecture of our 8 layer convnet model. A 224 by 224 crop of an image (with 3 color planes) is presented as the input. This is convolved with 96 different 1st layer filters (red), each of size 7 by 7, using a stride of 2 in both x and y. The resulting feature maps are then: (i) passed through a rectified linear function (not shown), (ii) pooled (max within 3x3 regions, using stride 2) and (iii) contrast normalized across feature maps to give 96 different 55 by 55 element feature maps. Similar operations are repeated in layers 2,3,4,5. The last two layers are fully connected, taking features from the top convolutional layer as input in vector form ( $6 \cdot 6 \cdot 256 = 9216$  dimensions). The final layer is a C-way softmax function, C being the number of classes. All filters and feature maps are square in shape.
